## Proxy for real value of generic assets

Real value of generic assets  $fwy_t$ 

$$\mathit{fwy}_t = \mathit{fwy}_t^{\mathrm{fund}} \cdot \mathit{fwy}_t^{\mathrm{bubble}}$$

where

- $\mathit{fwy}_t^{\mathrm{fund}}$  is the fundamental value (based on the "correct" present value of future cash flows)
- $\mathit{fwy}_t^{\mathrm{bubble}}$  is a "bubble", i.e. a persistent deviation of the observed (market) value from its fundamental value

#### Fundamental macro-based real value of assets

The value of existing assets is proportional to the (hypothetical) present value of claims on future real economic activity (i.e. a discounted sum of future GDP.

The discount factor depends on the hypothetical (unobservable) level of lending rates that would cover all lending costs and (expected) risks

$$extit{fw} y_t = (1-\delta_{ ext{ss}}) ~ \mathrm{E}_t \Big[ y_t ~+~ \delta_{t,t+1} \cdot rac{y_{t+1}}{y_{ ext{ss}}^{ ext{roc}}} ~+~ \delta_{t,t+1} \cdot \delta_{t+1,t+2} \cdot rac{y_{t+2}}{y_{ ext{ss}}^{ ext{roc}}} ~+~ \cdots \Big]$$

with the discount factor between t and t+1 defined as

$$\delta_{t,t+1} \equiv rac{1}{1+c_0+c_1 \cdot r_t^{
m cond}}$$

where

- $oldsymbol{\delta}_{
  m ss} \equiv rac{1}{1+c_0}$  is the steady-state discount factor
- $oldsymbol{y}_{
  m ss}^{
  m roc}$  is the steady-state (gross) rate of growth in real output

## Technical corrections for steady state

For analytical and calibration convenience, we want

$$\mathit{fwy}_{\mathrm{ss}} = \mathit{y}_{\mathrm{ss}}$$

To achieve this, we make two types of technical corrections

$$extit{fw} y_t = \overline{\left[ (1 - \delta_{ ext{ss}}) 
ight]} \operatorname{E}_t \left[ y_t \; + \; \delta_{t,t+1} \cdot rac{y_{t+1}}{\overline{\left[ y_{ ext{ss}}^{ ext{roc}} 
ight]}} \; + \; \delta_{t,t+1} \cdot \delta_{t+1,t+2} \cdot rac{y_{t+2}}{\overline{\left[ y_{ ext{ss}}^{ ext{roc} \; 2} 
ight]}} \; + \; \cdots 
ight]$$

## Recursive representation of the present value

The model specification cannot handle infinite forward sums. The fundamental value of assets needs to be rewritten into forward recurive form

$$extit{fw} y_t = \left(1 - \delta_{ ext{ss}}
ight) \, \mathrm{E}_t \Big[ y_t \; + \; \delta_{t,t+1} \cdot rac{ extit{fw} y_{t+1}}{y_{ ext{ss}}^{ ext{roc}}} \Big]$$

#### Asset price bubble

A bubble is a persistent (autocorrelated) deviation of the observed (market) value of assets from the fundamental value

$$\log \mathit{fwy}_t^{\mathrm{bubble}} = c_0 \, \log \mathit{fwy}_{t-1}^{\mathrm{bubble}} + arepsilon_t$$

In the long run, we assume that the value of assets is consistent with their fundamental value, and bubble does not exist

$$\mathit{fwy}_{\mathrm{ss}} = \mathit{fwy}_{\mathrm{ss}}^{\mathrm{fund}}$$

$$\mathit{fwy}_{\mathrm{ss}}^{\mathrm{bubble}} = 1$$
